Lectura de noticias,
2013, 2017 y 2022*

*En 2013 y 2017 la pregunta se refirió a la lectura de diarios, en formato papel o digital, el último año. En la tercera edición de la ENCC, se consultó por la lectura de noticias en diarios, páginas web o redes sociales.

Frecuencia de lectura de noticias por soporte, 2022

Lectura de noticias,
por edad, 2022

- Casi 7 de cada 10 argentinas/os leen noticias en redes sociales, diarios en papel y/o digitales. La lectura frecuente se registra más en redes sociales y en diarios digitales.
- Entre quienes leen con frecuencia noticias en redes sociales (48%), se destaca la presencia de personas de entre 18 y 29 años (59%).
- La lectura digital de noticias se realiza, sobre todo, a través del celular.
- El 18% de la población leyó revistas el último año y sólo el 1% de las personas encuestadas está suscrita a revistas digitales.

How digital media drive affective polarization through partisan sorting

Petter Tönnberg^{1,2,3}

Edited by Helen Milner, Princeton University, Princeton, NJ; received April 25, 2022; accepted August 30, 2022

Politics has in recent decades entered an era of intense polarization. Explanations have implicated digital media, with the so-called echo chamber remaining a dominant causal hypothesis despite growing challenge by empirical evidence. This paper suggests that this mounting evidence provides not only reason to reject the echo chamber hypothesis but also the foundation for an alternative causal mechanism. To propose such a mechanism, the paper draws on the literatures on affective polarization, digital media, and opinion dynamics. From the affective polarization literature, we follow the move from seeing polarization as diverging issue positions to rooted in sorting: an alignment of differences which is effectively dividing the electorate into two increasingly homogeneous megaparties. To explain the rise in sorting, the paper draws on opinion dynamics and digital media research to present a model which essentially turns the echo chamber on its head: it is not isolation from opposing views that drives polarization but precisely the fact that digital media bring us to interact outside our local bubble. When individuals interact locally, the outcome is a stable plural patchwork of cross-cutting conflicts. By encouraging nonlocal interaction, digital media drive an alignment of conflicts along partisan lines, thus effacing the counterbalancing effects of local heterogeneity. The result is polarization, even if individual interaction leads to convergence. The model thus suggests that digital media polarize through partisan sorting, creating a madmen in which more and more identities, beliefs, and cultural preferences become drawn into an all-encompassing societal division.

Significance

Recent years have seen a rapid rise of affective polarization, characterized by intense negative feelings between partisan groups. This represents a severe societal risk, threatening democratic institutions and constituting a metacrisis, reducing our capacity to respond to pressing societal challenges such as pandemics, or rise in digital media may of differences, which linked to a breakdown cohesion and rise in polarization, by ide digital media may of differences, which linked to a breakdown cohesion and rise in polarization, by ide digital media may of differences, which linked to a breakdown cohesion and rise in polarization, by ide

News sharing on Twitter reveals emergent fragmentation of media agenda and persistent polarization

Abstract

News sharing on social networks reveals how information disseminates among users. This process, constrained by user preferences and social ties, plays a key role in the formation of public opinion. In this work, we used bipartite news-user networks to study the news sharing behavior of main Argentinian media outlets in Twitter. Our objective was to understand the role of political polarization in the emergence of high affinity groups with respect to news sharing. We compared results between years with and without presidential elections, and between groups of politically active and inactive users, the latter serving as a control group. The behavior of users resulted in well-differentiated communities of news articles identified by a unique distribution of media outlets. In particular, the structure of these communities revealed the dominant ideological polarization in Argentina. We also found that users formed two groups identified by their consumption of media outlets, which also displayed a bias towards the two main parties that dominate the political life in Argentina. Overall, our results consistently identified ideological polarization as a main driving force underlying Argentinian news sharing behavior in Twitter.

Keywords: Complex networks; Social media; News consumption; Natural language processing

1 Introduction

Mass media plays a preponderant role in the formation of public opinion [1, 2], as an increasing proportion of the population is exposed to media outlets and actively engages in sharing news on social media platforms [3–5]. Therefore, the process of opinion formation is influenced by how information spreads on social media [6, 7]. In turn, this circulation depends on the connectivity between users, reflecting ties based on intellectual or ideological affinity, membership to certain social groups, or shared trust in influential individuals or organizations, among other factors [8–10]. Thus, as these social ties translate into the user connectivity backbone, social networks become clustered and modular, resulting in topological constraints on information flow that can be analyzed using methods from complex network theory.

Polarización- redes- audiencias. Debates

- La personalización algorítmica produce burbujas informativas y aumenta la polarización. (Cámaras de eco)
- Los algoritmos amplifican la polarización, no la crean (exposición selectiva y la homofilia de los usuarios)
- La polarización es principalmente afectiva antes que ideológica
- Exposición a perspectivas divergentes (cross-cutting exposure).
¿Reduce o amplifica la polarización?
